SUMMARY

Business Intelligence and Financial Analyst with 2+ years of experience delivering data-driven insights, financial reporting, KPI analysis, forecasting, and dashboard development across healthcare and financial services industries. Skilled in SQL, Power BI, Excel, Python, and data visualization, with proven success in automating reporting processes, improving forecast accuracy, and supporting strategic decision-making through financial and operational analysis. Experienced collaborating with cross-functional stakeholders to translate business requirements into actionable insights that drive growth, profitability, and operational efficiency.

EXPERIENCE

UnitedHealth Group, *Business Intelligence Analyst* 02/2024 – Present | USA

- Developed monthly operational and financial performance reports for leadership teams, providing visibility into utilization trends, cost drivers, and business KPIs.
- Built and maintained executive dashboards in Power BI that tracked key performance indicators, supporting strategic planning and performance management initiatives.
- Collaborated with finance, operations, and clinical stakeholders to analyze trends, identify opportunities for process improvements, and support data-driven business decisions.
- Performed data validation and cleansing activities to improve reporting accuracy and strengthen forecasting reliability across multiple business units.

Sage Softtech, *Senior BI Analyst* 11/2023 – 11/2024 | India

- Spearheaded root cause analyses for revenue leakage across equity and fixed income desks by querying trade reconciliation logs and settlement data via complex SQL joins, reducing exception rates by 28%.
- Developed end-to-end ETL pipelines using Alteryx Designer and Python to cleanse, transform, and merge large-scale trade, pricing, and market data (~50M records/month) from internal and Bloomberg APIs.
- Created high-impact Power BI dashboards with DAX-driven metrics (e.g., trade P&L by desk, slippage analysis, and riskweighted asset ratios), enabling traders and risk officers to monitor real time exposure.
- Automated recurring regulatory and financial reporting workflows using Python (pandas, NumPy) and Excel VBA, cutting report generation time by 60% and ensuring compliance with SEC & MiFID II standards.
- Conducted exploratory statistical modeling on client transaction data to segment institutional vs. HNI investor behavior using clustering techniques and logistic regression, supporting product strategy decisions.
- Collaborated with risk and compliance teams to build anomaly detection logic for suspicious trades, integrating Z-score-based outlier detection into ETL workflows using Python and Alteryx macros.
- Designed ad hoc investigative reports for senior leadership using Excel Power Query, SQL, and Python visualizations (matplotlib/seaborn), surfacing alpha-generating trade patterns and market timing insights.

EDUCATION

Avila University,
Master of Science (MS) - Computer Science Management

12/2024 – 12/2026 | Kansas City, USA

TECHNICAL SKILLS

Data Analysis & Reporting (Excel, Power BI, Tableau, Data Analysis, KPI Reporting, Dashboard Development, Data Visualization, Report Automation) | **Business Process & Risk Management** (Business Process Evaluation, Process Documentation, Risk Assessment, Risk Classification, Compliance Analysis, Gap Analysis, Root Cause Analysis) | **Research & Stakeholder Management** (Requirements Gathering, Stakeholder Interviews, Business Documentation, Process Mapping, Data Interpretation, Business Analysis) | **Programming & Analytics** (Python, SQL, R, VBA, DAX) | **Data Management** (Data Cleaning, Data Validation, Data Wrangling, ETL Processes, Database Management) | **Tools & Productivity** (Microsoft Excel, PowerPoint, Word, Power Query, Power Pivot, Microsoft Office Suite)

ACADEMIC PROJECT

German Credit Rating Prediction, *Language Used: Python* 03/2024 – 05/2024

- Engineered and analyzed consumer credit card application data to detect abnormalities, deploying classifiers like Decision Tree, Logistic Regression, and Multi-Layer Perceptron (MLP) for model optimization and improved prediction accuracy.
- Evaluated model performance using accuracy scores and confusion matrices, fine-tuning classifiers based on business objectives to drive real-world application improvements and enhance overall model effectiveness, predictive power, and reliability.

Brain Tumor Detection, *Language Used: Python* 08/2023 – 12/2023

- Trained Convolutional Neural Network models such as VGG-16 and ResNet50V2 using labeled datasets, for the detection of Brain tumors. The dataset was collected from Kaggle and it had scan reports of the tumor and without tumors which we used for modeling.
- This concept helps to identify tumors when fed into an ML model, contributing to early diagnosis of brain tumors from the MRI scan reports, provided as a dataset, improving detection accuracy and enabling timely medical intervention.

Fraud Detection in Financial Transactions, 03/2023 – 06/2023

Language Used: Python

- Extracted and transformed financial transaction data using SQL and Python, utilizing Isolation Forest, DBSCAN, SVM, and Gradient Boosting models to achieve 90% precision in detecting fraudulent transactions and improving detection capabilities.
- Implemented an automated fraud detection pipeline with Airflow, integrating real-time alerts into the risk management system, reducing manual fraud reviews by 30% and enhancing overall operational efficiency and system performance.
